SEL-2241 Real-Time Automation Controller (RTAC)

Each SEL Axion® system requires an RTAC module to serve as the system CPU. The SEL-2241 RTAC has all of the communications and custom logic capabilities of the standalone RTAC modules, but is mounted in and receives power from the Axion backplane.

Front-Panel

The following figure shows the RTAC status LEDs that aid system troubleshooting and the connectors for communications and wiring.

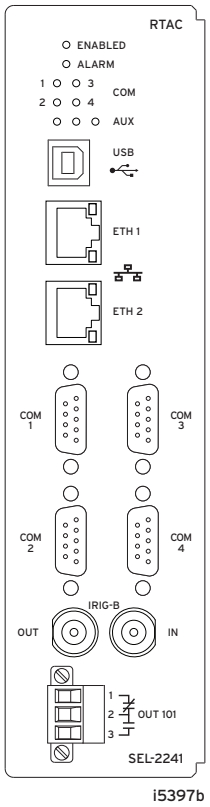

Figure 1 SEL-2241 RTAC Front Panel, Copper Ethernet

Mechanical Installation

Each SEL-2242 chassis/backplane has ten slots, labeled **A** through **J**. Only Slot **A** supports the SEL-2241 RTAC module.

Figure 2 Notch for Module Alignment

To install the RTAC, tip the top of the module away from the chassis, align the notch on the bottom of the module (shown in *Figure 2*) with Slot **A** of the chassis, and place the module on the bottom lip of the chassis as *Figure 3* illustrates. The module is aligned properly when it rests entirely on the lip of the chassis.

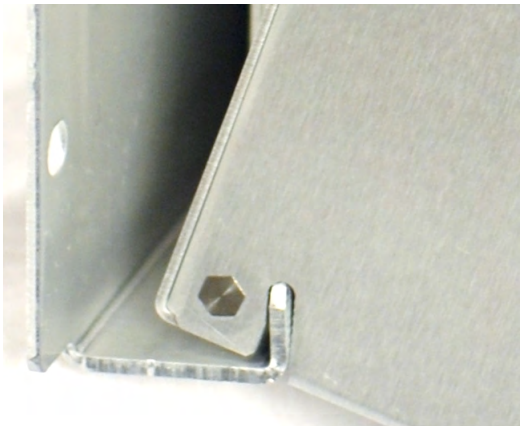

Figure 3 Proper Module Placement

Next, carefully rotate the module into the chassis, making sure that the alignment pin fits into the corresponding slot at the top of the chassis (refer to *Figure 4*). Finally, press the module firmly into the chassis and tighten the chassis retaining screw.

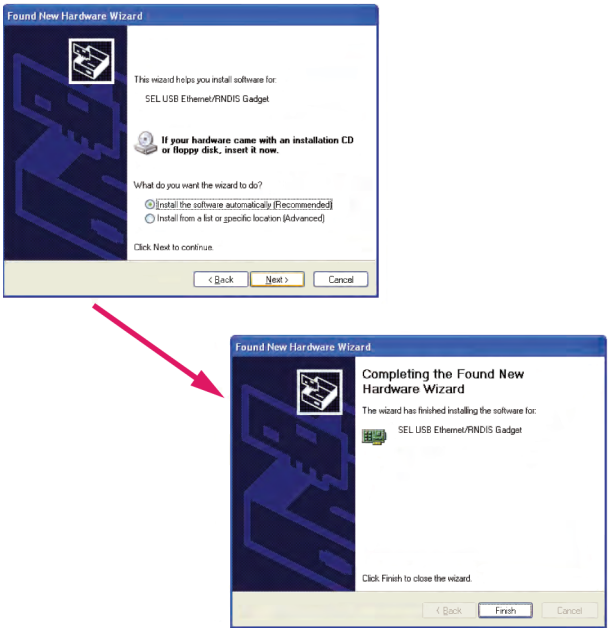
Connections

Communications Ports

NOTE: Never connect two RTACs via USB to one PC.

All web access, settings changes, and ODBC connections use either the RTAC Ethernet ports or the front USB type B port. Until you have configured the Ethernet interfaces on the RTAC, you will need to use the supplied USB type B cable to access the RTAC web interface. The ACSELERATOR RTAC installation will place the required USB driver on your PC so that you can allow Windows to install the driver automatically when it detects the USB connection. Plug the USB cable into the RTAC and into your PC. If you receive a prompt to connect to Windows Update, select **No, not at this time** and press **Next**. Then use the Windows Device Installation Wizard and follow the automatic install prompts to install the SEL USB driver.

After completing this step, you can use IP address 172.29.131.1 to access the RTAC web interface through the USB cable. See *Section 7: Security and Account Management* in the *ACSELERATOR RTAC SEL-5033 Instruction Manual* for RTAC web password setup.



The SEL-2241 has four nonisolated serial ports. You can select all RTAC serial ports through software to be either EIA-232 or EIA-485/EIA-422. You can configure any serial protocol on the RTAC to use any of these serial ports. See *Table 1* for the pinout of the RTAC serial ports.

Table 1 Nonisolated Female DB-9 Ports

EIA-232	EIA-485/EIA-422
Pin 1: N/C or +5 Vdc (also DCD input on COM 1 if +5 Vdc is disabled)	Pin 1: N/C or +5 Vdc (also DCD input on COM 1 if +5 Vdc is disabled)

IRIG-B OUTput	Female BNC	SEL-C953

Outputs

Refer to *Specifications on page 5* for output contact ratings and *Figure 3* for terminal assignments. Configure the contact output under SystemTags (Contact Outputs Tab) in ACSELERATOR RTAC. You can change the name of the point, create an alias tag name, and initialize status values. The RTAC will use the initialized value until run time, when it uses the actual value.

Figure 5 shows that a trip coil has a resistive and inductive component. After a trip output has been closed for a long time, the current settles to a steady-state value. When the trip output opens, it tries to interrupt the inductive current that wants to continue to flow (V = L di/dt). This attempted interruption of current causes a large voltage spike that can turn into an arc. When the contacts bounce during the arc, they often weld closed. SEL has designed, tested, and specified the outputs for this application to prevent any such welding. See the *Breaking Capacity on page 6*.

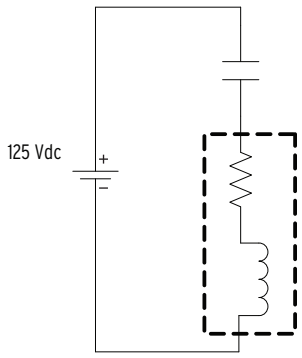

Figure 5 Inductive Interrupt of a Trip Output

LED Indicators

In addition to LEDs representing module status and communications activity, the SEL-2241 has three user-programmable bi-color LEDs. Configure these LEDs under SystemTags (LEDs Tab) in ACSELERATOR RTAC.

Field Serviceability

You can upgrade RTAC firmware and custom programming in the field or remotely over Ethernet. Self-tests provide status indication of errant conditions that can occur in the RTAC. You can map one or a combination of these or other status indications to the alarm contact to create a diagnostic alarm.

Module Replacement

To replace the SEL-2241 RTAC, perform the following steps.

Step 1. Back up all RTAC settings. See *Section 1: Getting Started* in the *SEL-5033 Instruction Manual* for instructions on how to back up and restore RTAC projects.

Step 2. De-energize any power source connected to the power coupler(s) in the Axion node.

Step 3. Loosen retaining screws and remove the terminal strip for the alarm contact. Disconnect all communications cables.

Step 4. Loosen the chassis retaining screw at the top of the module.

Step 5. Tip the top of the module away from the chassis and lift it from the bottom lip.

Step 6. Install the new module according to the applicable mechanical installation instructions in this section.

Step 7. Make all necessary connections to the module according to the applicable connection instructions in this section.

Step 8. Apply power to the Axion node.

Step 9. Use IP address 172.29.131.1 to access the RTAC web interface through the supplied USB cable. See *Section 7: Security and Account Management* in the *SEL-5033 Instruction Manual* for RTAC web password setup. Also enable all necessary communications ports.

Step 10. Download the settings project from ACSELERATOR RTAC.

Real-Time Clock Battery Replacement

The only field-replaceable component is the real-time clock battery, which cannot be recharged. A lithium battery powers the clock (date and time) during loss or removal of the external power source. The battery is a 3 V lithium coin cell, Rayovac no. BR1632 or equivalent. At room temperature (25°C), the battery will operate nominally for ten years. When the device receives power from an external source, the battery experiences a low self-discharge rate. Thus, battery life can extend well beyond ten years.

To replace the real-time clock battery, perform the following steps.

Step 1. Follow the *SEL-2241 Disassembly* instructions to expose the circuit board.

Step 2. Locate the battery clip (holder) on the board.

Step 3. Carefully remove the battery from beneath the clip. Properly dispose of the old battery.

Step 4. Install the new battery with the positive (+) side facing up.

Step 5. Follow the *SEL-2241 Reassembly* instructions.

Step 6. Set the device date and time.

⚠DANGER
Disconnect or de-energize all external connections before opening this device. Contact with hazardous voltages and currents inside this device can cause electrical shock resulting in injury or death.

⚠CAUTION
The device contains devices sensitive to Electrostatic Discharge (ESD). When working on the device with the front panel removed, work surfaces and personnel must be properly grounded or equipment damage may result.

Jumpers

The SEL-2241 RTAC jumpers come preset and should not be moved except as *Section 3: Factory Reset* in the *SEL-2240 Instruction Manual* describes. *Table 3* shows the configurable jumper positions.

Table 3 Configurable Jumper Positions

Jumper	Position

[a] Factory-default position.

SEL-2241 Disassembly

To disassemble the SEL-2241 RTAC, perform the following steps.

Step 1. Follow the *Module Replacement* instructions.

Step 2. Remove the six retaining screws (two top, two rear, two bottom).

Step 3. Place the module on its side and lift the cover to expose the circuit board.

SEL-2241 Reassembly

To reassemble the SEL-2241 RTAC, perform the following steps.

Step 1. Gently close the cover until the retaining screw holes are aligned.

Step 2. Replace the six retaining screws.

Step 3. Follow the *Mechanical Installation* instructions.
